## Executive Summary

C-lyrics is a public website that will generate a word cloud for any given artist based on the 250 most frequently used words that appear across all of the artist's published songs. This product will interface with the EchoNest API which will serve as the database from which we find and analyze the songs. By clicking on a specific word in the word cloud the user can see a list of all of the songs that word appears in and how frequently it occurs in each song. Furthermore, the user can click on any listed song title to see the complete lyrics for that song with the original word selected from the word cloud highlighted every time it appears.

C-lyrics is intended for use by the general public. There will be no login required and there is no stored history of previous searches. Because of this we will have very low memory requirements and can run the product off of one server. The user can access C-lyrics using any device running any OS. After typing in the artist name and selecting the submit button, the word cloud will be generated in approximately one second and will be able to be shared via Facebook.

# 1. Introduction

## 1.1 Purpose

The purpose of this document is to clearly describe every aspect of the first group project for the CSCI-310 course taken at the University of Southern California in the Spring semester of the year 2015. The intended audiences of this software requirements specification document includes, but is not limited to: the members of group six whose names are listed on the front page of this document and by whom this document is prepared and the professor of the course Dr. William G. Halfond. Other possible audiences include: students who are at the time of this publication taking the course in which this project is assigned or any future students of this course who may read this document should it become available to them by the course instructor Dr. William G. Halfond or by any other means which cannot be predicted at this time. This software development project will hereafter be referred to as C-lyrics. It is intended for any user with an internet connection-either through a mobile or stationary platform-who wishes to create a word cloud based on the lyrics of songs from various artists.

## 1.2 Scope

C-lyrics is a web based application for generating a black font, horizontally positioned text, word cloud generated from song lyrics of an artist selected by the user. User will simply search for a desired artist and if the artist's lyrics are supported by C-lyrics, a word cloud of the most common words that appear in the artist's various songs will display for the user.

C-lyrics will be hosted and available to the World Wide Web and will require no user registration or membership. To access the C-lyrics service, a user only needs an internet connection and one of the commonly used web browsers. C-lyrics will use the EchoNest API to generate the lyrics of selected artists and will then log a list of songs where the lyrics are derived from, including a word cloud of the most common words from the those lyrics.

### 1.3 Definitions, Acronyms, and Abbreviations

Term	Definition
AJAX	Asynchronous JavaScript And XML. Technology allowing the transfer of data from between the front-end and back-end without reloading the web page.
Autocomplete	Autocomplete refers to the functionality addition to the Search Bar, allowing users to enter minimal characters and choose artists that are most similar to the string.
Autocomplete Delay	A feature designed for the search bar when a user is typing. The delay refers to the suspending action while the user is typing, making the request to the server for autocomplete.
API (EchoNest)	API will refer to the EchoNest API. EchoNest is a free API that allows developers to retrieve lyrics and artist information in web pages and other programs.
Backend	References the PHP backend page.
Back to home button	A button redirecting the user to the homepage.
Back to songs button	A button redirecting the user to the songs list page.
bg_color	Placeholder variable for white.
Customer	Dr. William G. Halfond
Desktop Platform	A screen whose width exceeds 560px.
Development Team	All of the individuals whose names appear on the cover of this document. These persons have collectively put this document together and will collectively implement the software product described in subsequent sections.
Facebook	Online social network service where the generated word cloud image may be shared amongst users.
Google Doc	An online service provided by Google Inc. where an editable document can be accessed and change simultaneously by the members who have been given access to the document. In the case of the development team, google doc is the shared resource which contains the source of this SRS document.
highlight_color	Placeholder variable for yellow.
Home Page	The first page of the website visited by the user. It contains the Word Cloud as well as the Search Bar.
Lyrics Page	The third page of the website, it contains the lyrics for one song, which is chosen by the user on the Songs Page. It will have two Navigation Buttons that can take the user to either the Home Page or back to the Songs Page.
main_color	Placeholder variable for purple.

Mobile Platform	A screen whose width is less than or equal to 560px.
Navigation Buttons	Refers to any button that takes the user to previously visited pages of the website.
page_color	Placeholder variable for gray.
prototype	A small prototype of the software including the bare-bones of the graphical display. Used during the second meeting with the client, screenshots available in the appendices.
Search Bar	The initial search bar on the first page of the website. Here, users can type in artist or band names to generate a word cloud.
Share Button	The standard, embeddable Facebook share button.
Software or Product	The application software delivered from the supplier to the customer.
Software Requirements Specification (SRS)	Refers to this document.
Song List	This will be the culmination of all songs found that contain the search word indicated by the user.
Songs Page	The second page of the website. It contains the Song List as well as a Navigation Button back to the Home Page. The user navigates to the Songs page by clicking on a word in the Word Cloud on the Home page.
Submit Button	The button adjacent to the Search Bar. When the user enters an artist name into the Search Bar and is ready to generate the Word Cloud, he or she must click on the Submit Button to begin the process.
Supplier	The team developing the product for the customer.
System	The set of machines running the software making it accessible to the user.
text_color	A placeholder variable for black.
User	A person who interacts with C-lyrics software.
Word Cloud (WC)	A word cloud (otherwise known as a tag cloud) is, according to the Oxford Dictionary, an image composed of words used in a particular text or subject, in which the size of each word indicates its frequency or importance [2].

## 1.5 Overview

Further sections of this document include detailed descriptions on various modules of the C-lyrics software and methods used to develop this SRS. In section 2, C-lyrics' various interfaces are described. In section 3, a detailed account of the customer's specifications is explained. To view the source of these customer requirements, refer to appendix A.1 near the end of the SRS which contains meeting notes between the development team and the customer. Finally, section 4 details the change management process by which changes to this SRS are submitted. The document concludes with the appendices which will provide an account of the information exchanged between the customer and the development team as mentioned before, and with some prototype design images.

## 2. Overall Description

### 2.1 Product Perspective

This product will be dependent upon data from the EchoNest API. The C-lyric system will be responsible for grabbing information given by the user via search box, and sending the artist name to EchoNest which will provide song lyrics for us to analyze and synthesize. From there, the C-lyrics system will filter the appropriate words to be displayed in the image of a word cloud. Provided the user has internet connection, C-lyrics will function on any mobile or stationary device.

#### 2.1.1 System Interfaces

There will be three main system interfaces for C-lyrics:

- The first interface will include a search box, \*send button, and share button, all adjacent to one another, and placed underneath a space dedicated to generate a WC.
  - To generate the WC, lyrics will be pulled from a database provided by the aforementioned APIs and filtered to display the 250 most frequently used words by any given artist.
- The second interface will be prompted after a user selects a word from the WC. This word will be displayed at the top of the screen, then list out all of the artist's songs in which the word occurs. This list will be organized by the frequency of the word's used in each song. A button will be displayed at the bottom where the user can go back to the first interface.

- The last interface contains all the lyrics of a specific song which the user selects from the generated list of the second interface. Two buttons will be located at the end of the lyrics, one where a user can go back to the first interface where their original search started and another that will go back to the second interface.

### 2.1.2

- Logical characteristics of each interface:
  - Interface I: Will contain a grey background and 4 key elements. It will have a white search box outlined in purple and two purple adjacent buttons on it's right side, one being a search button and the other being a share button for the word cloud. The search box will be located at the bottom of the page and the white search cloud will be generated above that will contain no more than 250 words. There should be enough space between the bottom of the page and the search box to contain a drop down for the auto-correct feature.
  - Interface II: Will also contain a grey background and 3 main aspects. The selected word from the WC will be the title of the page, and underneath the title will have a list of all songs that contains the searched word. There will be a button at the bottom of the page that allows the user to go back to the first interface.
  - Interface III: Will contain a grey background, and will have the title of the song and underneath will contain the lyric. The word that was selected from the WC will be highlighted in purple throughout the lyrics. Two buttons at the bottom of the page will allow the user to go from Interface I or Interface II.
- All aspects of optimizing the interface with the person who must use the system:
  - Interface I:
    - \* After at least 3 characters have been entered into the search bar and the user stops typing, a drop down list of suggested artists will appear
      - The auto-complete function will span the width of the search bar
      - The complete list of artists' names that begin with the characters typed in to the search bar will appear
      - There will be 5 artists' names visible initially with a scroll down bar to see the rest of the artists
      - There will be a picture of each artist to the right of their name
    - \* The user will be able to create a generated WC in under 1 second by pressing the submit button after typing in a specified artist

- If there are no lyrics available, or an artist was entered incorrectly, the space used for the word cloud will generate an error message to display to the user that the system was unable to identify lyrics given the artist specified
- \* The user will be able to share the generated word cloud via Facebook
- \* The user will be able to click on specific word to see all of the songs that word appears in from the specified artist. The song titles will be sorted by how frequently the selected word shows up in each song. (see Interface II)
- Interface II:
  - \* The user will be able to click on any song title displayed to see the complete lyrics of that song with the selected word highlighted in yellow every time it appears (see Interface III)
  - \* The user will be able to click on the back to home button to take them back to the generated word cloud with the artist name still displayed in the search box
- Interface III:
  - \* Displayed will be all the lyrics from the specified song in Interface II, and the title of the song will be the header of the page
  - \* The searched word will be highlighted whenever it appears throughout the lyrics
  - \* The user will be able to click on the back to cloud button to take them back to the generated word cloud with the artist name still displayed in the search box
  - \* The user will be able to click on the Back to Songs button to take them back to the list of songs that the specified word appears in

### 2.1.3 Hardware Interfaces

C-lyrics is an online, browser based application that will be supported by any device that has internet access and any browser that supports HTML5.

Access devices include but are not limited to any OS running on:

- Mobile phones
- Tablets
- Laptop and desktop machines
- Other internet enabled devices with browser support such as televisions

In addition, we will host the product on a virtual machine run server.

### 2.1.4 Software Interfaces

All required software interfaces will be handled by the EchoNest API on the back end of the product. The user does not need to worry about interfacing with any outside software.

EchoNest API

- We are using the EchoNest API as the database for storing all of the artists and songs. This API will provide the information for us to sift through and format into the WC.
- EchoNest API documentation can be found in section 1.4

### 2.1.5 Communication Interfaces

The chain of communication for C-lyrics will be the user input to the back-end system of C-lyrics, back end server communicating with the EchoNest API, then communication back to the interface to display information back to the user.

### 2.1.6 Memory constraints

C-lyrics will have no memory of previous searches or user data. All artist information and lyrics will be pulled from the database of our chosen APIs. Therefore the memory capability is not limited by C-lyrics, but by the capacity of the API. We will be able to host our product using one server.

## 2.2 Product Functions

The intended purpose of C-lyrics is to produce a word cloud based on all lyrics from a specified artist. The user will input an artist's name, thus generating a WC that contains frequently used words from all of their published songs. Several functions C-lyrics are as follows:

- Should have an auto-complete drop down when searching for artist as well as a complementary image per artist/band
- Allowing the user to select any word from the WC and generate a list of songs that contains the selected word along with the frequency of that word per song
- Displaying the lyrics of a specific song when selected from the generated list described in the bullet above

## 2.3 User Characteristics

C-lyrics is intended to be used by anybody with any education level and with no required technical background. It will be most helpful to music enthusiasts, but is not limited to their use. There is no necessary log in as C-lyrics is available to everyone. While there is no age requirement, explicit language in songs is not censored so children should be supervised when searching for artists.

## 2.4 General Constraints

The current constraints on the project are because of the feasibility of certain features. These include achieving complete accuracy on facial recognition per band, limited data per artists lyrics, and capability of capturing the image of a the word cloud.

For testing purposes, a simulating tool maybe be used to test out possible cases to ensure the outputs will be as desired, such as unit testing for front and back end, as well as end-to-end testing.

## 2.5 Assumptions and Dependencies

A number of factors that may affect the requirements in the SRS include:

- The limited amount of data provided by an API, not accounting for all lyrics specified
- Image recognition based on bands may not produce 100% accuracy when identifying artists or bands
- Capturing the individual words of the WC as a unified image
- Performance time may exceed the desired amount of time, being one second to produce the WC
- The performance of the API will be assumed as correctly functioning, therefore basing the WC on the primary function of the API

## 2.6 Apportioning of requirements

Requirements that may be delayed until future versions of the system have been completed will include:

- Pricing agreements for how much the system will cost per user and such a pricing policy will be administered and specified in a later version
- Capability to download the image onto a device and save it in the appropriate format

## 3. Specific Requirements

### 3.1 External Interface Requirements

#### 3.1.1 User Interface

**Page Color Scheme** For all three web pages (homepage, songs page, and lyrics page) the background should be light `page_color`. The default, `text_color` font of the browser should be used throughout the application. On the lyrics page, the highlighted text should be `highlight_color`. Other visual elements specifications will be defined in the following subsections.

**Search Bar and Submit Button** The search bar will receive the name of an artist as a query. This text shall be given as input by any means accessible to the user, but must exclusively contain alphanumeric characters. The search bar, including the submit button, will have the same width as the WC, on a desktop platform. On a mobile one, the search bar will be under the WC and above the submit button, all three of them having the same width. After the autocomplete delay, this text will be transmitted to the backend. The whole communication will be done through AJAX, and when the response arrives it will be handled by the autocomplete. The command to generate the WC is a mouse click on the submit button or the browser's command to submit a form (Usually the "enter" key). This will generate a word cloud given an artist name. In 100% of the cases, the time between the mouse click and the display of the WC should never exceed 1000 milliseconds.

The search bar will have a `text_color` text with a `bg_color` background. The borders will be `main_color`. The corners of the input box might be slight rounder (about 5px) and a placeholder is optional. The submit button should be `main_color` and its text should be `bg_color`.

The purpose of the search bar is to allow the user to select and search for a specific artist. Once the search has been performed and one artist has been selected, the submit button shall generate the WC.

**Autocomplete** The autocomplete acts as a response to the user's input in the search bar. Its input comes from a response of the server and will be in the JSON format. The autocomplete does not output a value, however it will modify the graphical interface of the application by appending a drop down to the search bar as described in Section 2. Once an artist has been selected through a mouse click on a list entry, the autocomplete will disappear from the graphical interface and the name of the artist will appear in the search bar. In 100% of the cases, this display of the dropdown will happen in less than 50 milliseconds after the response from the server has been received.

The borders of the autocomplete will be `main_color`, and the text and images inside the dropdown will be `text_color` over a `bg_color` background. The height of the images inside the dropdown will depend on the total window size, in order to avoid scrolling the main browser's window to reach the bottom of the dropdown. At any point in time, whether during the creation of the WC or creation of the autocomplete, the position of the search bar should never change relatively to the top of border of the browser window.

The purpose of the autocomplete is to help the user select a single entry from a list of artists whose names match the query in the search bar.

**Word Cloud** The word cloud takes as input a list of words and creates a `text_color` and `bg_color` graphic and displays it in the horizontal center of the home page (see Appendix for example). The graphic contains the words from the word list written in `text_color` over a `bg_color` background. The size of the graphic will span 75% of the window on a desktop platform and the entire screen width on a mobile one. The words appearing in the graphic are the set of all words in lyrics of all songs by the selected artist, and are received from the backend. Note that these words should not include the most common english stop-words. These words have a different size depending on the frequency at which they appear in the songs. A conditional requirement is to have a waiting spinner during the time the WC is being generated. In the case where the searched artist does not exist, there should be a `text_color` error message over a `bg_color` background, in place of the WC.

Next to the WC there should be a share button. By clicking on it, the user will have the possibility to share the displayed WC on Facebook.com. This button will have the standard Facebook color scheme.

The purpose of the WC is to display the frequency of words in an artist's discography and offer a visually pleasant interface to access a list of songs containing a selected word.

**List of Songs** The list of songs on the songs page offers very little interaction. It is generated as list of the songs' titles. For each title, the list displays the title with a link on it and the number of occurrences of the the word in this song. The link is `main_color` and the text of the counting is of `text_color` of a `bg_color` background. The list is centered in the page. At the bottom of the page there is the back to home button which has the same color scheme as the submit button. It is not possible to reach the songs page without having specified which artist and which word the user wants to inspect.

The purpose of the list of songs is to allow the user to select a song of which he wants to see the lyrics. He also has the possibility to go back to the homepage through the back to home button.

**Lyrics** The lyrics page offers even less interaction than the songs page. The only possible input is a click on one of the two buttons: the back to home button and the back to songs button. The only possible input for both of these navigation buttons is a mouseclick. Once the click is done, the timing for the action to occur should take less than 300ms in 100% of the cases. Both of the buttons' behaviour is specified in Section 3.2. It is also not possible to reach this page, without having first specified an artist, a word, and a song whose lyrics will be displayed. The lyrics of a given song are displayed at the top center of the page, aligned to the left hand-side of the screen. All occurrences of the word that was clicked in the WC are highlighted in the highlight color.

### 3.1.2 Hardware Interface

**Server** The system shall be one or several machines serving the page to the user's browser and be able to make HTTP requests on the API. In order to achieve those tasks, the machine should have a modern internet connection ( $\geq 10\text{Mb/s}$  in upload) as well as the TCP/IP port 80 open and accessible from anywhere on the internet.

### 3.1.3 Software Interfaces

**Apache Server** The Apache [HTTP Server project](#) will be responsible for serving the static content to the user's browser as well as requesting data from the API. As such it will require access to the port 80 of the machine. In addition, the backend should have access to persistent memory of the system.

**JavaScript** The browser should have full support of ECMAScript 5 and be able to make asynchronous JavaScript and XML requests through the HTTP protocol. It should also be able to correctly display HTML5 and CSS3 elements.

## 3.2 Functional Requirements

This section specifies principal actions and functions of the software.

### 3.2.1 Homepage

**Artist Search and Selection** The user shall be able to search artists for which he wants to create a WC. In order to access this functionality he should just start typing in the search bar and pause for autocomplete delay seconds. After this delay has passed, the user is presented with a list of artists and he will be able to select one from the dropdown.

**Creation and Display of the Word Cloud** By clicking on the submit button, the user will see a waiting spinner before the WC is generated. Once the the backend answered the request of the frontend, the WC will be generated within the next 50ms. The world cloud will provide links to the songs list page as and will implement the color scheme specified in Section 3.1.1.

**Transition to the Songs List** Through a single mouse click on one of the words in the WC, the user should be redirected to the songs page. For this function to work, every word in the WC must be linked to the same web page (songs list) but passes different parameters to the page, which will adapt itself to those given parameters. Several abnormal cases are possible:

- The internet connection is dropped: Minor problem, as the content of each song and each word will be stored in the browser's memory. However in such a case, the system should make sure that the template for the songs page is cached in the memory as well.
- The user clicks on a second image before the songs page has been loaded: Note that this case is very extreme, as the transition from a page to another should take less than 50ms. However if this happens, then the user shall be redirected to the songs page for the second he clicked, and not the first one. This problem could arise through the asynchronous nature of JavaScript.

Instead of ensuring that the redirection link is valid which is a tedious task, the system should ensure that a non-valid link is never generated.

**Sharing of the Word Cloud** The software shall offer the possibility of sharing the currently generated WC on Facebook.com through the click of a button. In order to access this functionality, the user should have first created a WC by selecting an artist and clicked on the submit button. Then, Facebook's embeddable share button will appear on the right of the submit button and the user will be able to perform a mouse click. By doing so, the user will be presented with Facebook's visual display to share the WC on their web page. Note that as the supplier is not the provider of this functionality, they can not ensure any kind of consistency in the user experience of the share button, nor in its availability.

### 3.2.2 Songs Page

**Count of Words per Song** This functionality shall determine the number of occurrences of a given word in a song. It is essential as it will determine the number that will be appended next to a song's title in the songs list. In order to activate this functionality the user will only have to browse the songs page and the computations will be done automatically. Again, this should only be

possible if the software is given a word to look for and an artist's discography. In the special case where either one or both of these conditions are not met, the user should be redirected to the homepage. The number of occurrences is not expected to go over the maximal value of JavaScript however if it does, then an error message should notify the user. This error message will have the same behaviour as a standard browser popup.

**Transition to the Lyrics Page** By clicking on a song's title, the user should be redirected to the lyrics page which will display the lyrics of the selected song. This link shall not provide any wrong parameters to the lyrics page and it will only be activated through a mouse click event. The transition will be similar to the browser's transition of a web page to another. An abnormal behaviour would be an interrupted internet connection, in which case the software will have cached the requested web page, as well as the necessary data (ie, the song's lyrics and information) in the browser's memory. Another special case would be if the user clicks on two links at the same time, or if the second link is clicked before the lyrics page has been loaded. In such a case, whichever link was clicked last shall be loaded by the software and displayed to the user.

**Transition to the Homepage** The back to home button shall offer the possibility of being redirected to the homepage through a mouse click. If this action is executed, then the homepage will be displayed exactly as the user left it when navigating to the lyrics page. As the link to the homepage will always be the same, the function will need to check that the stored data history fulfills the requirements to re-render the exact same homepage. If this is not the case, then the software shall not try to render a partial view of the page but will simply display the original, blank homepage. If the internet connection is suddenly dropped, then the software shall furnish a cached version of the template and the data that was requested. In the special case where two redirecting events overlap, the software will then redirect the user to the one finishing last.

### 3.2.3 Lyrics page

**Highlighting of the Matching Words** Once the user navigates to the lyrics page after selecting a song from the songs page, the word that was originally clicked in the WC will be highlighted in the lyrics page. The highlighter color will be yellow. The highlighted words will be neither clickable nor changeable, unless the user goes back to the homepage and selects a different word entirely.

**Transition to the Songs List** The user shall be able to transition back to the songs page by single clicking the navigation button. The songs list on the songs page will be generated according to the same word from the WC. The transition will be the same navigating to a new page, but with the same data

before arriving to the lyrics page. There will be no parameters when navigating back to the songs page because the old parameters will not be changed.

**Transition to the Homepage** Similar to the Transition to Homepage from 3.2.1. The user will navigate back to the homepage via the navigation buttons. The homepage will look exactly the same based on the original artist the user selected prior to arriving to the lyrics page.

### 3.3 Performance Requirements

All functions in the homepage, songs page, and lyrics page shall be performed in under one second, assuming that the user runs the software on a standard machine with a stable connection. The software will be available for a private user but can be opened to the public given proper web hosting. Once it is hosted, the software can accommodate multiple users at the same time. There will be no user data stored longer than a single session. All calls will be made to the API for data retrieval.

### 3.4 Design Constraints

The software may be constrained by the hardware available by the user. The software will require an internet connection as well as a machine that is capable of loading web pages in a reasonable time constraint. Without an internet connection, the software will be unable to run. A machine incapable of loading web pages will not be able to run the software.

## 4. Change Management Process

This document is anticipated to change over time as requirements, scope, and specifications change. To accommodate for changes, all member of the development team will decide on the changes to be made. Afterwards, a selected member will access the master document which will be accessible to all members through the group's google doc to input the changes. All members will then review the material and edit said change(s) if need be. Finally, after the editing process the document with the new additions and change or changes will be submitted, meaning that it will be officially part of the SRS.

## 5. Appendixes

### A.1: Appendix 1: Notes From Meetings With Customer

#### A.1.1: First Meeting on January 26, 2015

##### Natural Language Specifications

- Standard Scenario User Interface
- Go to the home page
- Type artist name in search box
- Click “submit” button next to search box
- When clicking on the search from the drop down, it will populate the search bar w/ that artist
- Display to be updated w/ word cloud of user selected artist lyrics
- Descriptive error message in the word cloud (“couldn’t find the artist”), if artist not found in search
- Would like input search box to stay there after cloud is generated
- When a word on the cloud is clicked, go to second page
- Second page has the song listings for the specified artist. when a word is clicked on the cloud, display a list of all the songs that have that word in the lyrics and the frequency of the word
- Button will be on second page, after the words have been listed
- When link of a song is clicked, want to see all the lyrics and that word to be highlighted
- Button to go from page 3 to 2 and page 3 to 1
- When going back to page 1 from any page, it should populate the original search of the user

##### Graphical User Interface

- Page background color: solid grey background for the main page
- Input box: outlined in purple w/ white background inside the box and black text when typing search item
- “Submit” button should be purple, will initialize search for inputted text in search bar
- Specific colors for word cloud: black text on a white background
- Word cloud display box shape should be rectangular
- Highlighting should be purple
- Use default font for the browser screen
- Shape of text should be “something cool”
- Word cloud text should be black and white

### Constraints and Restrictions

- Product could have limited amount of artists. Finite number
- No restrictions on songs
- Must use PHP
- No java, no ruby, no .NET
- No restrictions on server hosting
- Search results and display to be returned in 1 second
- Do not keep history

### Word Cloud Functionality

- Size of the word should be proportional to it's frequency
- Stop word filter on articles, pronouns

### Optional Features

- Loading spin graphic when generating word cloud
- Share lyrics on facebook

#### A.1.2: Second Meeting on January 28, 2015

- Q1. Are there more than three pages?
- A1: No
- Q2. Where should the “share link” be?
- A2: Button shows up next to the submit button to share with the same theme as the search button
- Q3. How many songs should be on per page?
- A3: ALL the songs from artist
- Q4. Do you want pagination of the list of songs?
- A4: no need for pagination, all results on one page
- Q5. Is the word cloud supposed to just be a rectangle? Is there even a cloud?
- A5: It is a rectangle
- Q6. What about spacing in the rectangle?
- A6: The whole background is white, so spaces are all white
- Q7. Is the search box supposed to be at the bottom?
- A7: Yes
- Q8. How large should the word cloud be?
- A8: “must be visually pleasant”
- Q9. On second page, should it be in order of title (A-Z) or should it be in  
\* greatest to least of number count?

- A9: ordered by word count, in decreasing order
- Q10. How many letters does the auto-complete need to start after?
- A10: “whatever is reasonable”
- Q11. What color should the auto-complete box be? What about the color of the \* words?
- A11: White background, black text, purple border
- Q12. Does the rectangle resize based on how many words are in it?
- A12: No
- Q14. Lyrics on the third page, adjustment? Left, center, right?
- A14: Left aligned
- Q15. What happens when you click on the lyrics?
- A15: Nothing
- Q16. What visually on the first page? Just the search box and the go button?
- A16: From top to bottom: empty area above for word cloud, a search box with a submit button to its right and a share button to the right of the submit button when cloud is generated
- Q17. What is being shared? The word cloud? The list of pages for the songs \* that have a specific word? The actual song and its lyrics?
- A17: word cloud
- Q18. Is the speed of how fast it took to search supposed to be shown?
- A18: Doesn’t matter
- Q19. Want a count of how many words are in the cloud (google example)? What color if so? What font? What size?
- A19: No word count
- Q21. How important is the download? What’s the priority?
- A21: it is optional

### A.1.3: Third Conversation With Client on 2/1/2015

- Q1. When you erase the artist’s name from the search box does the cloud disappear or does it only disappear when you try to generate a new cloud?
- A1: Only when a new cloud is generated
- Q2. Are the words supposed to be arranged in the cloud in a random way or are they alphabetical, sorted by frequency, etc? If placement of each word is random, when you generate a cloud for a given artist multiple times should the generated cloud be the same or different every time?
- A2: No particular preference for arranging the words in the cloud
- Q3. Is the drop down list of suggested artists anyone whose name contains that string or anyone whose name starts with that string?
- A3: Either way is fine
- Q4. How should the layout change for mobile uses? Do you want the “Generate Cloud” button to be under the search bar to save space? Should

the word cloud take up the whole screen?

- A4: My only expectation is that the website in general should look good and be readable on a mobile device. What you have suggested are good ideas.
- Q5: What is the purpose in ordering this product?
- A5: The sole purpose is to allow my end users to create a word cloud of the songs' lyrics of a given artist.
- Q6: How do you plan to use this product and who is your target customer? Is this product only for you or should it be public for the general population to use?
- A5: This product is meant for the general population. The end users will access the product using a website.
- Q7: Is there any specific functionality you don't want this product to have?
- A7: No
- Q8: Who do you consider as competitors who have a similar product?
- A8: None that I am aware of
- Q9: How should we deal with poor internet connection in regards to the 1 second search requirement? And more generally, what should we expect from the user(s) of the application in regards to the hardware they are going to use ? (eg, should we support very old machines, very low performance devices, etc. . . )
- A9: For the 1 sec requirement, I see your point. However, the response time should be reasonable, say 5 sec, and the end users should not have to wait for a very long time to see the results. If the internet connection is very poor, then maybe you can display some informative message to the user. With respect to the hardware requirement, it is difficult to say the kind of platforms the end users will be using, since the website is meant to be used by the general public.

## A.2: Appendix 2: Complete Specifications Notes

### Website Layout

- solid gray background
- all words black text on a white background – default font on top
- textbox and wordcloud on top of the button
- input box to be outlined as purple with inside white and black text, button is purple themed with readable words (black, purple, etc)
- blank screen and then the word cloud shows up when pressed make cloud
- can you exit out of the word cloud like a pop up
- no log in or history
- back button same theme as submit and share button and when you go back the word cloud is still there, the search result doesn't go away until

- you type in a new artist
- descriptive error messages

### Shape of Cloud

- use tagcloud or wordle
- adaptable sized rectangle based on number of words in the cloud (no more than 250 words – make it look nice)
- all horizontal words
- no overlap of words
- the prototype with white background only on the word is ok

### Search Results

- top 5 most relevant results with a scroll bar that shows all of the results
- yellow highlight in the song on the third page
- autocomplete to start after a reasonable amount of letters
- second page songs sorted by frequency
- lyrics are left aligned
- list all songs on the second page and scroll all the way down
- use reputable lyric sites – doesn't have to be perfect
- support “all years” of music 50's or 60's
- don't show search length or number of results
- the word cloud should be able to be shared on FB (no where else) but doesn't need to be downloaded
- button shows up next to the submit button to share with the same theme as the search button
- from lyrics page can only go back to the word cloud or the song list page
- pictures in the drop down of the artists, don't care if they are circles or squares
- something that is useful be it their face or something else useful
- EchoNest has a lyric find functionality

### Website Structure

- control logic on server side based on PHP but you can have some Javascript/ CSS/ HTML
- build a local server on a virtual machine and host it there
- USC offers free hosting

### Hardware requirement on SRS

- only a computer, pretend that we will put it up on a server

### Software Interfaces on SRS

- where the APIs are coming from etc

### Communication Interfaces on SRS

- not as applicable, could just leave it out entirely

### Functional Requirements on SRS

- one user type so only User Type One – what the user can do not how they can do it

### Performance Requirements on SRS

- less than one second desired, could be longer though

## A.3: Appendix 3: Screenshots of Prototype

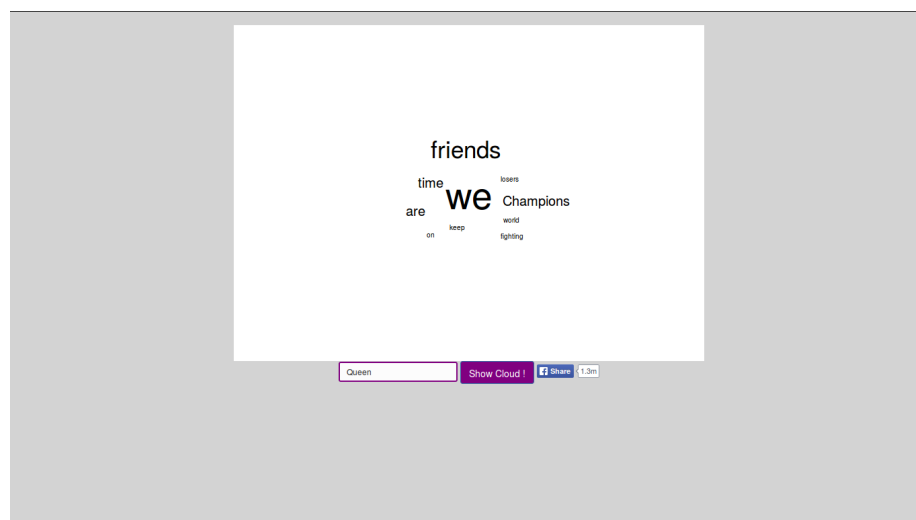

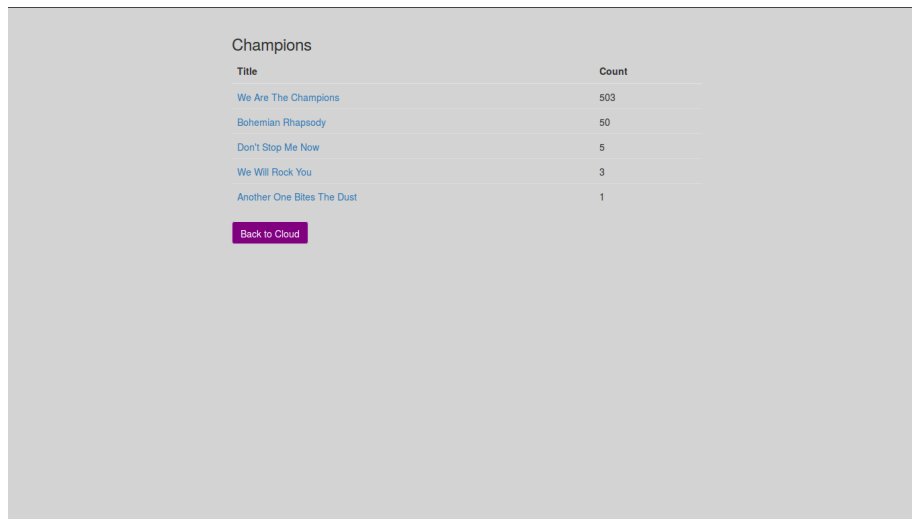

Figure 1: Screenshot of the Homepage

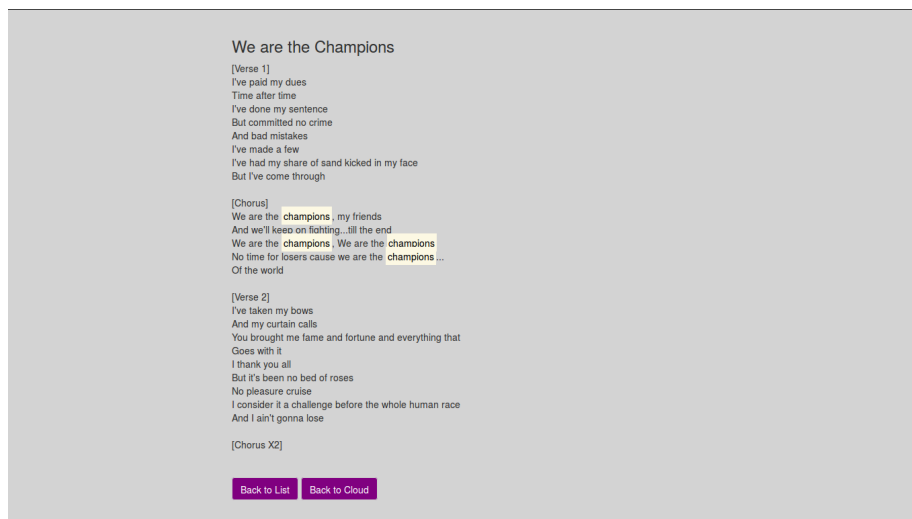

A screenshot of a web application titled "Champions". It features a table with two columns: "Title" and "Count". The table lists five songs: "We Are The Champions" (503), "Bohemian Rhapsody" (50), "Don't Stop Me Now" (5), "We Will Rock You" (3), and "Another One Bites The Dust" (1). Below the table is a purple button labeled "Back to Cloud".

Title	Count
<a href="#">We Are The Champions</a>	503
<a href="#">Bohemian Rhapsody</a>	50
<a href="#">Don't Stop Me Now</a>	5
<a href="#">We Will Rock You</a>	3
<a href="#">Another One Bites The Dust</a>	1

[Back to Cloud](#)

Figure 2: Screenshot of the Songs List

A screenshot of a web application showing the lyrics for the song "We are the Champions". The lyrics are organized into sections: [Verse 1], [Chorus], [Verse 2], and [Chorus X2]. The word "champions" is highlighted in yellow in the chorus. At the bottom, there are two purple buttons: "Back to List" and "Back to Cloud".

**We are the Champions**

[Verse 1]  
I've paid my dues  
Time after time  
I've done my sentence  
But committed no crime  
And bad mistakes  
I've made a few  
I've had my share of sand kicked in my face  
But I've come through

[Chorus]  
We are the **champions**, my friends  
And we'll keep on fighting... till the end  
We are the **champions**, We are the **champions**  
No time for losers 'cause we are the **champions** ...  
Of the world

[Verse 2]  
I've taken my bows  
And my curtain calls  
You brought me fame and fortune and everything that  
Goes with it  
I thank you all  
But it's been no bed of roses  
No pleasure cruise  
I consider it a challenge before the whole human race  
And I ain't gonna lose

[Chorus X2]
